

Why Choose Dr. Cheng?

Dr. Cheng specializes in treating a wide range of male sexual health conditions, including erectile dysfunction (ED), premature ejaculation, and other sexual dysfunction issues. He has successfully treated thousands of male patients with sexual health conditions, including erectile dysfunction (ED), low libido, and erectile dysfunction caused by other diseases.

Dr. Cheng successfully performed China's first CT-guided stereotactic brain innovative transplantation surgery. He also has extensive clinical experience in the diagnosis, treatment, and post-operative rehabilitation of diseases such as cerebral palsy, brain injury, spinal cord injury, post-stroke sequelae, and post-thrombotic sequelae, using novel transplantation techniques.

Male ED patients' biggest concern

1. Can therapy restore my natural erection? How long before the effects become apparent?
2. How can I ensure that my privacy is not leaked?
3. What are the price differences between the traditional method and stem cell therapy and why?

Our answer to you is stem cell therapy can solve the above problems

▶ Key Functional Improvements

Motor Function Enhancement

Natural Recovery

Stem cells rebuild erectile tissue permanently.

Absolute Privacy

No recurring prescriptions or visible treatments.

Cost-Effective

Long-term savings over decades of pill use.

After One Week:

Morning erections resume, Increased sexual desire, Improved erectile function, Restored physical energy. Ability to complete sexual intercourse normally

After Four Weeks:

Penile girth and length increase by 1-3 cm or more. Improved blood engorgement and erection firmness. Longer duration of erection and extended intercourse time. Enhanced sensitivity of all senses and increased satisfaction. Greater stamina, faster recovery, and increased sexual frequency

Symptoms:

Fatigue, poor sleep, dull skin tone, serious erectile dysfunction and premature ejaculation, chills, and persistent pain in the right limb.

Despite multiple health checks showing no abnormalities and the use of various supplements, results were unsatisfactory.

Before treatment

Lack of energy, easy fatigue, poor sleep quality, dull skin.

Sexual dysfunction (severe erectile dysfunction and premature ejaculation), cold intolerance, persistent pain in the right limb

The client had undergone multiple physical examinations without any abnormalities and had taken various nutritional supplements, but the results were unsatisfactory.

He received therapy from March 11 to March 25, 2017.

Post-treatment Outcomes

Sleep quality significantly improved, full of energy, enhanced sexual function.

Hands and feet became warm, the phenomenon of cold intolerance completely disappeared, no longer needing to wear a coat for warmth when going out, only a T-shirt is enough.

The persistent pain in the right limb completely disappeared, the strength in the right leg returned to normal, and the limping gait due to right leg pain during walking disappeared, allowing for free movement.

The body has fully recovered to health, and work enthusiasm is high.

Case 2- Sexual disharmony

Name: Mr. Qian

Age/Gender/ Nationality: 32 years old from Shandong, China

Symptoms:

He often experienced dizziness, fatigue, poor sleep, low appetite, was underweight, had back and knee pain, and lacked energy.

Before treatment

His penis was short, resulting in an unsatisfactory sex life, and he often needed alcohol to perform sexually.

In October 2020, he received treatment.

Post-treatment Outcomes

Enhanced energy and alertness

Better sleep quality and increased appetite

Gained weight

Subjective improvement in penile girth and length

Improved sexual performance

Case Three- Male ED caused by other diseases

Name: Mr. Liu

Age/Gender/ Nationality: 43 years old, from Harbin, China

Causes of illness: Diabetes for ten years

Symptoms:

He developed complications such as diabetic retinopathy, nephropathy, and peripheral neuropathy. He also suffered from severe sexual dysfunction, alternating between erectile dysfunction and anejaculation, as well as fatigue, low energy, frequent illness, poor sleep, and back pain.

• Our treatment method differs from ordinary stem cell treatment •

Intravenous Infusion

Arterial Infusion via the Dorsal Penile Artery

Localized Injection into the Penis

• Mechanism of Action •

After injecting, our product migrates to inflamed and damaged areas → precise targeting of the affected site → differentiation into penile tissue cells → restoration of the required number of normal cells in the body → promotion of angiogenesis in ischemic tissues → repair of central nervous system damage → immunosuppression and anti-inflammatory effects → restoration of normal male function

Before injection

Diabetes mellitus leads to occlusion of the dorsal penile artery, resulting in reduced blood supply to the corpora cavernosa and testes. Diabetes mellitus leads to occlusion of the dorsal penile artery, resulting in reduced blood supply to the corpora cavernosa and testes.

After injection

The dorsal penile artery reopened, the corpus cavernosum was visualized, and testicular blood supply increased.

• Core treatment advantages: Safety Guarantee Mechanism •

Long-Lasting Effects

Stem Cell can repair various damaged parts of the male mechanism, restoring it to a normal state with long-lasting and effective results. Medications, on the other hand, can only work within the body for a short period of time, losing their effectiveness once the drug effect wears off.

Safe and Free of Side Effects

The new object can naturally integrate with the human body, without any rejection reactions, and are safe and without side effects. Long-term stimulation of the body through medication can lead to drug resistance and cannot solve the problem from the "root," leading to more severe erectile dysfunction.

Address Multiple Causes of ED

Traditional treatments mainly involve the use of drugs, which temporarily improve erection by increasing blood flow. However, the effects are short-lived, tolerance can develop with prolonged use, and the root cause of ED remains unaddressed. Moreover, these medications may cause side effects like infertility or increase the risk of prostate cancer and cardiovascular diseases.

• Real Cases of Receiving Treatment •

Case 1:

Decreased sexual function

Name: Mr. H,

Age/Gender/ Nationality: 39 years old, Myanmar Nationality

Cause of illness: Due to years of irregular diet and sleep patterns, coupled with excessive energy consumption, the client experienced male function decline.

Before treatment

Has had diabetes for ten years. Fasting blood glucose: 8–12 mmol/L; post-meal blood glucose: 15–20 mmol/L. Despite daily insulin therapy, he developed complications such as diabetic retinopathy, nephropathy, and peripheral neuropathy. He also suffered from severe sexual dysfunction, alternating between erectile dysfunction and anejaculation, as well as fatigue, low energy, frequent illness, poor sleep, and back pain.

He received therapy from May 15 to May 23, 2018

Post-treatment Outcomes

One month after treatment, fasting blood glucose dropped to 5–7 mmol/L, post-meal glucose to 9–11 mmol/L. His erectile and ejaculation issues improved, sleep quality increased, energy levels rose, physical health was restored, and sensory responsiveness was enhanced.
